

Geometric Tools for Computer Graphics

Philip J. Schneider

David H. Eberly

*Author of the best-selling
3D Game Engine Design*

GEOMETRIC TOOLS FOR COMPUTER GRAPHICS

The Morgan Kaufmann Series in Computer Graphics and Geometric Modeling

Series Editor: Brian A. Barsky, University of California, Berkeley

Geometric Tools for Computer Graphics

Philip Schneider and David Eberly

Level of Detail for 3D Graphics

David Luebke, Martin Reddy, Jonathan D. Cohen, Amitabh Varshney, Benjamin Watson, and Robert Huebner

Texturing & Modeling: A Procedural Approach,
Third Edition

David S. Ebert, F. Kenton Musgrave, Darwyn Peachey, Ken Perlin, and Steven Worley

Jim Blinn's Corner: Notation, Notation, Notation

Jim Blinn

Understanding Virtual Reality

William Sherman and Alan Craig

Digital Video and HDTV Algorithms and Interfaces

Charles Poynton

Pyramid Algorithms: A Dynamic Programming Approach to Curves and Surfaces for Geometric Modeling

Ron Goldman

Non-Photorealistic Computer Graphics: Modeling, Rendering, and Animation

Thomas Strothotte and Stefan Schlechtweg

Curves and Surfaces for CAGD: A Practical Guide,
Fifth Edition

Gerald Farin

Subdivision Methods for Geometric Design: A Constructive Approach

Joe Warren and Henrik Weimer

Computer Animation: Algorithms and Techniques

Rick Parent

The Computer Animator's Technical Handbook

Lynn Pockock and Judson Rosebush

Advanced RenderMan: Creating CGI for Motion Pictures

Anthony A. Apodaca and Larry Gritz

Curves and Surfaces in Geometric Modeling: Theory and Algorithms

Jean Gallier

Andrew Glassner's Notebook: Recreational Computer Graphics

Andrew S. Glassner

Warping and Morphing of Graphical Objects

Jonas Gomes, Lucia Darsa, Bruno Costa, and Luiz Velho

Jim Blinn's Corner: Dirty Pixels

Jim Blinn

Rendering with Radiance: The Art and Science of Lighting Visualization

Greg Ward Larson and Rob Shakespeare

Introduction to Implicit Surfaces

Edited by Jules Bloomenthal

Jim Blinn's Corner: A Trip Down the Graphics Pipeline

Jim Blinn

Interactive Curves and Surfaces: A Multimedia Tutorial on CAGD

Alyn Rockwood and Peter Chambers

Wavelets for Computer Graphics: Theory and Applications

Eric J. Stollnitz, Tony D. DeRose, and David H. Salesin

Principles of Digital Image Synthesis

Andrew S. Glassner

Radiosity & Global Illumination

François X. Sillion and Claude Puech

Knotty: A B-Spline Visualization Program

Jonathan Yen

User Interface Management Systems: Models and Algorithms

Dan R. Olsen, Jr.

Making Them Move: Mechanics, Control, and Animation of Articulated Figures

Edited by Norman I. Badler, Brian A. Barsky, and David Zeltzer

Geometric and Solid Modeling: An Introduction

Christoph M. Hoffmann

An Introduction to Splines for Use in Computer Graphics and Geometric Modeling

Richard H. Bartels, John C. Beatty, and Brian A. Barsky

GEOMETRIC TOOLS FOR COMPUTER GRAPHICS

PHILIP J. SCHNEIDER

DAVID H. EBERLY

To my wife, Shelly, for her patience through yet another book —DE

FOREWORD

Eric Haines

On my shelf is an old book called *A Programmer's Geometry*, by Bowyer and Woodwark. It was published in 1983, reprinted twice in 1984 and 1985, but then discontinued. Over the years I have guarded my copy, keeping careful track of who borrowed it. Checking on the Web today, I found six used copies ranging in price from \$50 to \$100. This is a high price range for a paperback book only 140 pages in length. The reason the book is worth this much is that it describes how to program various operations related to 2D geometry. It does not just present geometric formulae; it also describes efficient ways to accomplish tasks and gives code snippets (in FORTRAN).

Now, almost two decades later, we have a worthy successor to that slim volume. The book before you distills a huge amount of literature on geometry into that which is most useful to programmers. The field of computer graphics has evolved considerably since 1983, and this volume reflects those advances. Due to the continuing improvement in computer processor performance, operations that once were only part of offline analysis packages are now commonly done in interactive programs. Polygon triangulation, collision detection and response, and surface modelling and modification are now possible at real-time rates. This book gives solid explanations and code to perform these and many other algorithms.

Beyond providing a solid reference for a wide range of geometry-related tasks, this volume also presents the underpinnings of the theory behind the algorithms. Rather than employ a pure cookbook approach, which can leave the reader with runnable code and no comprehension of how it works, the authors explain key concepts. This approach makes each algorithm a tool that, further on, can be recombined with other tools.

The dynamic nature of computer graphics makes it a particularly interesting area of study. Research and implementation of rendering methods respond to changes in the underlying hardware. For example, in the field of interactive rendering, the emerging programmable nature of the graphics accelerator has changed the relative costs of different techniques. On a broader scale, the evolution of the CPU has made memory access and caching rise in importance, compared to the older practice of minimizing the number of operations (e.g., counting multiplies and adds). However, the underlying theory and algorithms for, say, finding the convex hull of an object are considerably more long-lasting, less affected by changes. Of course, more efficient algorithms are found over time, and hardware influences which method currently is considered the fastest, but the basic principles remain the same. Years after you have

shed your books on DirectX 9 or Intel's 64-bit Itanium architecture, you are likely to have some edition of this book on your shelf.

Another reason this book will have increased staying power is the Internet. I am the archivist for the "Graphics Gems" series code repository. The code for this series of books, including code by Philip Schneider, was wisely made free for reuse when the series was published in the early 1990s. Over the years readers have sent in bug fixes and improvements to the code base, so benefiting all. Similarly, Dave Eberly has carefully maintained his "Magic Software" Web site (www.magic-software.com), which includes working versions of many of the algorithms presented in this volume. Called "a national treasure" by a leading researcher in computer graphics, this site allows addenda and corrigenda to be made available instantly whenever they are needed. Code does not rust; it improves with age when properly supported. This is particularly true for algorithms in this book as they are not tied to particular hardware, network protocols, or other transient objects.

Over the years I and many others have used algorithms and code by the authors in products and research projects. An hour of a programmer's time often costs more than the price of a book. By this measure, you hold a volume potentially worth thousands of dollars. That it can be purchased for a fraction of this cost I consider a modern miracle. The amount of information crammed into this book is incredible. The mathematics may be slow going at times, but the alternative would be to include wordier and less precise descriptions of fewer algorithms. If you are looking for a lightweight text you can read through and check off your list, keep searching. This book sometimes requires effort and struggle to fully comprehend but then, so do most of the worthwhile things in the world.

1 Introduction	1
How to Use This Book	1
Issues of Numerical Computation	2
<i>Low-Level Issues</i>	2
<i>High-Level Issues</i>	4
A Summary of the Chapters	6
2 Matrices and Linear Systems	9
Introduction	9
<i>Motivation</i>	9
<i>Organization</i>	13
<i>Notational Conventions</i>	14
Tuples	14
<i>Definition</i>	15
<i>Arithmetic Operations</i>	16
Matrices	16
<i>Notation and Terminology</i>	17
<i>Transposition</i>	17
<i>Arithmetic Operations</i>	18
<i>Matrix Multiplication</i>	20
Linear Systems	24
<i>Linear Equations</i>	24
<i>Linear Systems in Two Unknowns</i>	26
<i>General Linear Systems</i>	29
<i>Row Reductions, Echelon Form, and Rank</i>	30
Square Matrices	32
<i>Diagonal Matrices</i>	32
<i>Triangular Matrices</i>	34
<i>The Determinant</i>	34
<i>Inverse</i>	38
Linear Spaces	41
<i>Fields</i>	41
<i>Definition and Properties</i>	42
<i>Subspaces</i>	43
<i>Linear Combinations and Span</i>	43
<i>Linear Independence, Dimension, and Basis</i>	44
Linear Mappings	45
<i>Mappings in General</i>	45
<i>Linear Mappings</i>	47
<i>Matrix Representation of Linear Mappings</i>	49
<i>Cramer's Rule</i>	50

Eigenvalues and Eigenvectors	52
Euclidean Space	54
<i>Inner Product Spaces</i>	54
<i>Orthogonality and Orthonormal Sets</i>	55
Least Squares	56
Recommended Reading	60
3 Vector Algebra	63
Vector Basics	63
<i>Vector Equivalence</i>	63
<i>Vector Addition</i>	64
<i>Vector Subtraction</i>	65
<i>Vector Scaling</i>	65
<i>Properties of Vector Addition and Scalar Multiplication</i>	66
Vector Space	69
<i>Span</i>	70
<i>Linear Independence</i>	71
<i>Basis, Subspaces, and Dimension</i>	71
<i>Orientation</i>	73
<i>Change of Basis</i>	75
<i>Linear Transformations</i>	76
Affine Spaces	80
<i>Euclidean Geometry</i>	84
<i>Volume, the Determinant, and the Scalar Triple Product</i>	94
<i>Frames</i>	96
Affine Transformations	98
<i>Types of Affine Maps</i>	103
<i>Composition of Affine Maps</i>	103
Barycentric Coordinates and Simplexes	104
<i>Barycentric Coordinates and Subspaces</i>	106
<i>Affine Independence</i>	106
4 Matrices, Vector Algebra, and Transformations	109
Introduction	109
Matrix Representation of Points and Vectors	110
Addition, Subtraction, and Multiplication	113
<i>Vector Addition and Subtraction</i>	113
<i>Point and Vector Addition and Subtraction</i>	114
<i>Subtraction of Points</i>	115
<i>Scalar Multiplication</i>	115
Products of Vectors	115

<i>Dot Product</i>	116
<i>Cross Product</i>	117
<i>Tensor Product</i>	120
<i>The 'Perp' Operator and the *PerpODot Product</i>	121
Matrix Representation of Affine Transformations	126
Change-of-Basis/Frame/Coordinate System	128
Vector Geometry of Affine Transformations	132
<i>Notation</i>	133
<i>Translation</i>	134
<i>Rotation</i>	136
<i>Scaling</i>	142
<i>Reflection</i>	148
<i>Shearing</i>	153

FIGURES

2.1	Various ways of interpreting the example ambiguous transformation: (a) change of coordinates; (b) transformation of plane onto itself; and (c) transformation from one plane to another.	11
2.2	The solutions of the linear equation $3x_1 + 2x_2 = 6$.	26
2.3	Three possible two-equation linear system solutions.	27
2.4	Schematic diagram of a function.	46
2.5	Composition of two functions.	47
2.6	One-to-one, onto, and isomorphic maps.	48
2.7	One-to-one and onto functions.	48
2.8	An invertible mapping.	49
2.9	Least squares example.	57
3.1	Vectors as directed line segments.	64
3.2	Two vectors.	65
3.3	Two vectors drawn head-to-tail.	65
3.4	Vector addition.	66
3.5	Vector addition chain.	66
3.6	Vector subtraction.	67
3.7	Vector multiplication.	67
3.8	Vector negation.	68
3.9	Commutativity of vector addition.	68
3.10	Associativity of vector addition.	68
3.11	Distributivity of addition over multiplication.	69
3.12	Distributivity of multiplication over addition.	69
3.13	The span of two vectors in 3D space is a plane.	70
3.14	A vector as the linear combination of basis vectors.	72
3.15	Angle between vectors.	74
3.16	The right-hand rule for orientation.	75
3.17	A vector as the linear combination of two different sets of basis vectors.	76
3.18	The sine function.	77
